

Vikram Gupta, Sarvjit S. Bhatia

Abstract: Universally, technological innovations act as engine of growth for the developing economy. Technological revolutions act as an accelerator to enhance the economy worldwide. In the present scenario the technology has considerably impacted different aspects of life so that the business environment has changed thoroughly. Simply granting the access to the similar technologies utilized by the large business houses will flourish the business of small scale industries. As result flexibility, scalability, adaptability, availability, cost efficiency characteristics will be attained by adopting the innovation i.e. cloud based ERP in the organizations. Adopting Cloud based ERP system offers highly scalable, reliable, on-demand services with agile management capabilities on an as-needed basis. The present work is based on the concepts of social sciences and latest trends of information technology. In the framework, Diffusion of Innovation (DOI) Technology-Organization-Environment framework are synthesized. The framework examines and validates various social, technological, organizational and environmental factors that impact the cloud based ERP adoption. All these factors have significant impact on the adoption. The findings will propose practical recommendations to the successful adoption of cloud based ERP.

Index Terms: Cloud Computing, DOI, Enterprise Resource Planning, IaaS, PaaS, SaaS, TOE.

#### I. INTRODUCTION

Formerly the organizations contended on the basis of price or quality in the marketplace, but in the recent past, the business and trade surroundings has experienced intense changes. With these changes in the environment of the business, to survive in the market not only demands competitive price and quality but the satisfaction of the customers as well as service flexibility too [1]. To meet these challenges, the whole competitiveness of the enterprises has been extensively enhanced by the ERP systems. The ERP system combines with the latest tool of the information technology i.e. cloud computing leads to the modern era of trade and business and providing the solution towards the flexible, digital, networked and virtual enterprises by enhancing the resource configuration of the enterprise. Cloud ERP is one such modern time technology that lets the users and enterprises to access the internet on demand which is installed on vendor's site and use the ERP software as per requirement [2]. The basic concept of using cloud ERP is that as no initial

investment cost is required for the setup of IT infrastructure and pay per use structure, therefore low entry cost may be required while using this framework. The user can access cloud computing environment in three different forms i.e. into public cloud, private cloud and hybrid cloud. Public cloud is a cloud service which can be accessed by the user through the web browser. This service can be called pay as you go, as users has to pay based on the processing power or memory usage e.g. Amazon EC2 charges very few amount for using Virtual Machines. The approach is cost effective and efficient towards purchasing the new system hardware and software. In this kind, hardware system may be hosted in different locations anywhere. Private cloud is a cloud service setup which is hosted for a single client as per his own requirement within an organization. This cloud service is basically owned and managed privately by an individual or an organization. The access of the service is limited to the individual client and its partner network of the organization. Hybrid cloud is a blend of both public and private cloud. Cloud services provide three kinds of services to the users in the form of direct system usability service namely Software as a Service (SaaS), operating system platform service namely Platform as a Service (Paas) and computing infrastructure namely Infrastructure as a Service (IaaS) in public domain. The cloud ERP framework can be implemented and validated phase wise which has already been designed [3].

# II. CLOUD ERP FRAMEWORK

The framework is established by using DOI theory and TOE framework. These two theories are synthesized and implemented through ERP using the latest technology of cloud computing. The cloud ERP framework is distributed into three different phases:

1. Phase I The preliminary phase consists of two important factors knowledge and persuasion. These two factors are based on DOI theory:

#### i) Knowledge

The process of cloud ERP framework starts with the knowledge part. A related person learns about the existence of new innovative idea and look for the information about the same. In this part, the person tries to conclude about the new innovation and also it's working procedure [4].

#### ii) Persuasion

In this part of the phase, the related person has positive or negative approach towards the new innovative idea, but the creation of positive or negative approach does not always lead to an adoption or rejection of this idea directly or indirectly [4].

It will persuade to implement the cloud based ERP framework which is the combination of traditional and modern technology.

**2. Phase II** This phase is further divided into three factors i.e. technological, organizational and environmental factors. These factors help the organization to adopt and implement the innovation.

#### i) Technological

The factors that are considerably related to the internal and external technologies of the business organization are known as technological factors. The internal and external technologies help to implement the cloud based ERP framework. Equipment or practice may be the part of these technologies.

# ii) Organizational

The factors that comprise of all the characteristics and resources of the organization are known as organizational factors. The main factors of consideration of this study are size, management support, innovation, IT experience, scalability, upgradability, mobility and security.

# iii) Environmental

The factors those are associated with the surrounding elements of the organization in which it conducts the entire business activities are known as environmental factors. The factors under consideration are competition, nature of industry, scope and outside support.

3. *Phase III* This phase of the framework is divided into three parts i.e. decision, implementation and confirmation.

#### i) Decision

Decision signifies the condition in which the consumer or any top order decision maker involves in the activities to take a positive or negative decision to adopt the innovative idea. The positive decision means the complete use of an invented idea whereas negative decision means not to adopt this idea [4].

# ii) Implementation

It leads to an innovative idea that has to be put into use and practice. After taking positive decision, the concerned or top order decision maker puts this idea into the actual implementation.

#### iii) Confirmation

Confirmation leads to a state when the concerned or decision maker tries to reinforce and confirm the actual use of innovative idea under consideration or revert back from adopting this decision.

## III. EMPIRICAL VALIDATION OF FRAMEWORK

# Research Methodology

A research approach can be defined as the arrangements and the measures for research which includes the steps taken based on broad assumptions, comprehensive methods of collecting, analyzing and interpreting data [5]. To validate the present research framework is based on the questions in the questionnaire highlighted the theoretical and practical studies of the factors under consideration. Exploratory factor analysis method in SPSS version 25.0 and Confirmatory factor analysis method in Smart-PLS software (version 3.0) are used to analyze and validate the framework.

#### **Descriptive Statistics**

Descriptive statistics is necessary part of data analysis [6]. Respondents and organizations responses can be described using this statistics. In the present paper, SPSS 25 is used to calculate the mean and standard deviation of the variables for the research framework represented in the questionnaire. 5 point Likert scale has been used to measure the variables in the proposed research framework for twenty six factors.

The following table shows the mean level and the range of standard deviation of all the items used to measure the factors in the framework.

TABLE I: DESCRIPTIVE STATISTICS

Variables	Items	Mean	Std. Deviation
	KNOWLEDGE		
V1	IT knowledge is required for the adoption of cloud computing	4.32	1.112
V2	Third party plays role in the adoption of cloud computing	4.18	.911
V3	Outsourcing helps to implement the Cloud based ERP	3.78	1.059
V4	New techniques and innovation methods are required for the implementation of cloud based ERP	4.12	.922
	PERSUASION		
V5	Cloud computing is cheaper than in-house solutions	3.82	.965

V6	After implementation of cloud based ERP the profit will increase	3.68	1.112
V7	Saves time and labor	4.30	1.094
V8	Efficiency will increase and it helps to grow the business	4.48	.892
	RELATIVE ADVANTAGE		
V9	Cloud ERP helps to perform the tasks more quickly	4.07	1.071
V10	Quality of the work will improve	4.05	1.080
V11	Implementation cost is reduced	4.15	.820
V12	Improvement in the quality of the goods and services	3.93	.899
	UNCERTAINTY		
V13	Risk of project failure is always there	3.12	1.427
V14	Risk of security is present as the data is available on internet	2.82	1.621
V15	Fear of people losing their jobs	2.88	1.627
V16	System will collapse if not implemented successfully	3.75	1.174
	COMPATIBILITY		
V17	System will collapse if not implemented successfully Implementation of cloud based ERP	2.73	1.313
V18	The working will become easy using cloud based ERP	3.08	1.293
V19	Leads to reduction in execution time	3.33	1.174
V20	Enhances the productivity	3.43	1.047
	COMPLEXITY		
V21	Integration of Cloud with ERP leads to difficult situation	2.55	1.371
V22	Technical knowledge is required	2.92	1.139
V23	Execution of ERP application will become difficult as it has to be done through third party	3.33	1.052
V24	To convert the data from traditional ERP method to Cloud based ERP requires extra efforts	2.52	1.308
	TRIALABILITY		
V25	The first hand trial is done before the implementation of cloud based ERP	3.12	1.574
V26	The trial has been done module wise	3.75	1.114
V27	The live data trial is mandatory to implement cloud ERP	3.87	1.127
V28	Cloud service providers offer the services on a trial basis	3.82	1.112
	BUSINESS COST		
V29	After the implementation of cloud based ERP it reduces operational cost	4.12	.715
V30	Cloud ERP reduces hardware, infrastructure, software, staff and training cost	3.30	.997
V31	The cost of using cloud based ERP is less than installing or developing a technology in house	3.63	1.248
V32	Recurring cost is increased	3.45	.746
	USABILITY		
V33	Adopting Cloud ERP has increased Effectiveness	4.32	.748
V34	Efficiency has increased by adopting Cloud based ERP	4.30	.743
V35	Adopting Cloud ERP has increased satisfaction	4.33	.752
V36	It provides better services to customers	4.10	.986
	ACCESSIBILITY		
V37	Data can be accessed from anywhere at any time	3.82	1.017
V38	The transactions can be done globally	3.73	1.163
V39	The accessibility will reduce the time to complete the job	3.97	.974
V40	Cloud ERP enables organizations to access the data at affordable cost	4.20	.798
	IMPLEMENTATION TIME		
V41	Cloud based ERP takes less implementation time	3.43	.998
V42	Cloud based ERP helps to take the decisions in less time	3.53	1.241
V43	Lesser the implementation time better will be the quality of the product/service	3.77	1.031
V44	Method to implement the cloud based ERP is directly linked with implementation time	3.90	.706
	FIRM SIZE

#### IV. EXPLORATORY FACTOR ANALYSIS (EFA)

EFA is broadly utilized statistical methodology used in the fields of IS, education, and social science [7]. In the framework, twenty six constructs are taken into the account for the exploratory factor analysis. The factor loadings are used to show the correlation in the constructs and their variables. The factor loading value more than 0.5 for a factor is acceptable; and more than 0.7 is ideal [8]. Communality of a variable is the range to which a variable correlates with all other variables. The communalities with higher values are always better. The communalities for a specific variable between 0.0-0.3 signify that variable may be left because it struggles to load significantly. The first construct 'Knowledge' is measured using 4 variables v1, v2, v3 and v4. The communalities between these variables are 0.338, 0.576, 0.510 and 0.617. The factor loading of these items are 0.581, 0.759, 0.714 and 0.785. So due to its acceptable range, the construct Knowledge becomes valid. Similarly, for the second construct 'Persuasion' is measured 4variablesv5, v6, v7 and v8. The communalities of v5, v6, v7 and v8 are 0.175, 0.287, 0.601 and 0.779. As the communality value of v5 and v6 are <0.3 so these two variables will not participate in calculating the factor loading. Variables v7 and v8 are considered for calculating the factor loading. By eliminating v5 and v6 the communality values will improve to 0.716 and 0.716 and the factor loading will become 0.846 and 0.846 respectively. With this Persuasion factor will become valid. The similar procedure has been adopted to validate all the constructs. The highest factor loadings are coming out to be 0.994 for two factors i.e. 'Market scope' and 'Decision' whereas lowest loading is 0.558 for 'Innovativeness', which are highly acceptable. It can be seen from the table II that all the items have factor loadings greater than 0.5 which are highly significant and the constructs are valid.

# V.CONFIRMATORY FACTOR ANALYSIS (CFA)

CFA approach is used to establish the reliability and validity of the scale. Smart-PLS software (version 3.0) is used in this research. CFA is a constrained model approach in which items belonging to a construct are not allowed to load on to the other construct. Fig. 2 exhibits the CFA measurement model exhibiting the twenty six constructs with their measurement variables measuring the constructs.

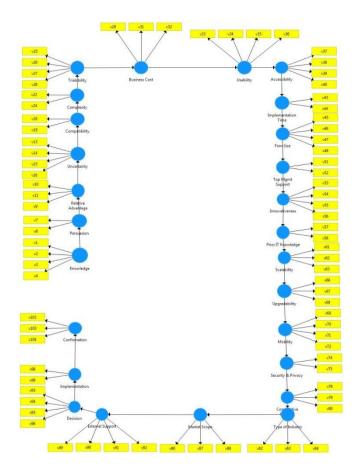

Fig. 2: CFA Model

Reliability and Validity of Scale

The reliability of scale of various constructs is established using Composite reliability and Cronbach's alpha and validity is performed using convergence which is as shown in table III.

# i) Composite Reliability (CR)

Composite reliability is the measure of reliability of factor scores ranging from 0 (completely unreliable) to 1 (perfectly reliable). The minimum recommended value of CR is 0.7. The constructs are said to be adequate when the CR scores are greater than the recommended cut-off of 0.7 [9]. As shown in table III, the minimum reported CR is 0.854 for construct 'business cost' whereas maximum CR is reported to be 0.978 for the construct 'Usability', which in both cases are very high and therefore these are significant. For all the constructs CR scores exceed 0.7, and thus, the model is considered reliable.

# ii) Cronbach's Alpha

Cronbach's alpha is the measure of reliability of scale. The reliability or internal consistency of all the factors towards the Cloud ERP adoption in this research has been observed using Cronbach's alpha. Alpha coefficients are evaluated as the value greater than equal to 0.7 acceptable, greater than 0.5 poor and less than equal to 0.5 unacceptable [10].

From table III, it is shown that the lowest and highest reported alpha is coming out to be 0.738 and 0.970 respectively for 'Compatibility' and 'Usability' constructs which are found to be highly acceptable and significant. For all other constructs also, alpha scores exceed 0.7, thus the model is considered to be reliable.

#### iii) Convergent Validity

Convergent validity is the measure in which variables of a particular construct shares variance in common. The scale has been established by calculating Average Variance Extracted (AVE) value for each of the construct. The minimum recommended value of AVE is 0.5 to achieve the validity. As shown in the table III, the minimum reported AVE value 0.613 is related to the construct 'Knowledge' and is above the minimum threshold value of 0.5, which means that the variables of the constructs are more than 61% of variance of each construct, which is very strong support to the convergent validity.

Table III: Reliability and Validity Analysis

S.	Constructs/			Average
No.	Factors	Cronbach's	Composite	Variance
		Alpha (α)	Reliability	Extracted
			·	(AVE)
1.	Knowledge	0.801	0.863	0.613
2.	Persuasion	0.835	0.923	0.857
3.	Relative	0.866	0.920	0.793
	Advantage			
4.	Uncertainty	0.904	0.935	0.787
5.	Compatibility	0.738	0.882	0.789
6.	Complexity	0.783	0.901	0.821
7.	Trialability	0.957	0.949	0.823
8.	Business Cost	0.745	0.854	0.661
9.	Usability	0.970	0.978	0.919
10.	Accessibility	0.891	0.925	0.755
11.	Implementation	0.947	0.974	0.949
12	Time	0.050	0.070	0.000
12.	Firm Size	0.959	0.970	0.890
13.	Top Management Support	0.915	0.959	0.921
14.	Innovativeness	0.880	0.913	0.731
15.	Prior IT	0.020		0.022
	Experience	0.929	0.965	0.933
16.	Scalability	0.882	0.926	0.808
17.	Upgradability	0.869	0.919	0.790
18.	Mobility	0.920	0.943	0.807
19.	Security & Privacy	0.922	0.962	0.927
20.	Competitive	0.808	0.886	0.722
	Pressure	0.808	0.000	
21.	Type of Industry	0.862	0.914	0.779
22.	Market Scope	0.914	0.947	0.856
23.	External Support	0.919	0.944	0.810
24.	Decision	0.962	0.973	0.899
25.	Implementation	0.935	0.969	0.939
26.	Confirmation	0.893	0.902	0.757

From the above, a reliability and validity of scale has been established to measure the factors affecting cloud ERP adoption in various organizations. The scale is measured for twenty six valid constructs in the study. All the constructs have good level of reliability and high level of validity.

#### VI. CONCLUSION

Global challenges forces the academic innovators to make the revolutionary changes in the business. The combination of the theories of social sciences and the latest trends of IT creates the drastic changes in the present market scenario. The findings of the study promotes the use of cloud based ERP using the components of DOI and TOE theory. The

Retrieval Number: D2810028419/19©BEIESP

Journal Website: www.ijitee.org

framework has been validated with good level of reliability and high level of validity using the exploratory and confirmatory factor analysis. For academia, this research provides very useful reference for future studies in the subject area of social sciences and cloud based ERP, especially in developing countries.

#### **AUTHORS PROFILE**

Vikram Gupta is Associate Professor in PG Department of Computer Science at GSSDGS Khalsa College Patiala and registered Ph.D. scholar in Computer Science & Engineering at Uttarakhand Technical University Dehradun. He has 20 years of work experience in the field of teaching. He is an active member of IAENG. He has published over 8 papers in International and National Journals. His research area is

Interfacing of Cloud Computing with ERP.

Dr. Sarvjit Singh Bhatia is a researcher and Senior Faculty in PG Department of Computer Science at GSSDGS Khalsa College Patiala. He has 21 years of work experience in the field of teaching and 10 years of research experience. He has published 15 books and 6 research papers in International and 5 in National journals. His major research area is Implementation of

Cloud based ERP in SMEs.
